Wireframe:

- The form I'm thinking of will, upon submit, if there is text in the text entry, trigger a browser notification that says “you’ve been hacked! (not really)” or something along those lines. For the whimsy, of course.

Logo/favicon:

- Will likely round the border slightly without adding a border, to give it a pill look as it hangs down from the header. Will do the same for the nav bar items. Might remake the logo to have the white replaced with the Light color below

Color Scheme:

- I am using the basic color scheme from the Flatly bootswatch template because I think it looks nice, and it's the color scheme I'd like to make my future portfolio site so I want practice seeing how the colors interact.

Color	Use	Hex
	Primary (header/footer background)	#2c3e50
	Secondary (Nav Background/other backgrounds)	#95a5a6
	Dark (Text on light, dark background)	#7b8a8b
	Light (Text on dark, light background)	#ecf0f1
	Emphasis (Links, borders, nav hover background	#18bc9c

Fonts:

Font Name	Use	Source:
Courier New	Headings	Web Safe
Roboto	General Text	Google Fonts
Arial	Backup General Text	Web Safe

- The HTML to import the font from google fonts will be embedded in the head tag:

```
<style>
@import
url('https://fonts.googleapis.com/css2?family=Roboto+Condensed:ital,wght@0,100..900;1,100..900&display=swap');
</style>
```
